In the claims:

For the Examiner's convenience, all pending claims are presented below with changes shown.

- 1 1. (Original) A method comprising:
- 2 receiving a first identification (ID) at a computer system from a server via a
- 3 transmission medium;
- 4 comparing the first ID with a second ID stored at a first analog front end coupled
- 5 to the computer system; and
- 6 certifying a first software-defined radio for operation if the first ID matches the
- 7 second ID.
- 1 2. (Original) The method of claim 1 further comprising disabling the first
- 2 software-defined radio if the first ID does not match the second ID.
- 1 3. (Original) The method of claim 1 further comprising storing the first ID in a
- 2 memory device within a baseband unit at the computer system prior to comparing the
- 3 first ID with the second ID.
- 1 4. (Original) The method of claim 1 further comprising downloading a protocol
- 2 corresponding with the first software-defined radio.
- 1 5. (Original) The method of claim 4 wherein the first ID and the wireless
- 2 protocol are received as a component of a signed manifest.
- 1 6. (Original) The method of claim 5 further comprising:
- 2 validating the signed manifest; and
- 3 executing the protocol at a baseband unit if the manifest is validated.
- 1 7. (Original) The method of claim 1 further comprising:

- 2 receiving a third identification (ID) at the computer system from the server via the
- 3 transmission medium;
- 4 comparing the third ID with a fourth ID stored at a second analog front end
- 5 coupled to the computer system; and
- 6 certifying a second software-defined radio for operation if the third ID matches
- 7 the fourth ID.
- 1 8. (Original) A computer system comprising a first software-defined radio
- 2 including:
- a baseband unit; and
- a first analog front-end coupled to the baseband unit;
- 5 the first software-defined radio being certified for operation by authenticating a
- 6 first identification (ID) received at the baseband unit with a second ID stored at the first
- 7 analog front end.
- 1 9. (Original) The computer system of claim 8 further comprising:
- an input/output (I/O) bus coupled to the baseband unit; and
- a network controller coupled to the I/O bus.
- 1 10. (Original) The computer system of claim 9 wherein the first ID is received
- 2 from a server computer via a transmission medium coupled to the network controller.
- 1 11. (Original) The computer system of claim 10 wherein a protocol
- 2 corresponding to the first software-defined radio is also received from the server
- 3 computer.
- 1 12. (Original) The computer system of claim 9 wherein the baseband unit
- 2 comprises:
- an I/O interface coupled to the I/O bus;

- a digital signal processor (DSP) coupled to the I/O interface; and
- 5 a second bus coupled to the DSP.
- 1 13. (Original) The computer system of claim 12 wherein the baseband unit
- 2 further comprises:
- a volatile memory coupled to the DSP; and
- a non-volatile memory coupled to the DSP.
- 1 14. (Original) The computer system of claim 12 wherein the analog front end
- 2 comprises:
- analog-digital/digital-analog (AD/DA) conversion logic coupled to the second
- 4 bus;
- 5 modulation logic coupled to the AD/DA conversion logic;
- a transceiver coupled to the modulation logic; and
- 7 an antenna coupled to the transceiver.
- 1 15. (Original) The computer system of claim 14 wherein the analog front end
- 2 comprises a non-volatile memory that stores the second ID.
- 1 16. (Original) The computer system of claim 12 further comprising a second
- 2 software-defined radio including:
- 3 the baseband unit; and
- 4 a second analog front-end coupled to the baseband unit;
- 5 the second software-defined radio being certified for operation by authenticating a
- 6 third ID received at the baseband unit with a fourth ID stored at the second analog front
- 7 end.
- 1 17. (Original) A network comprising:
- 2 a first client computer;

- a transmission medium coupled to the first client computer; and
- a server computer, coupled to the transmission medium, that transmits first
- 5 identification (ID) data to the first client computer upon receiving a request from the
- 6 client computer to certify a first software-defined radio implemented at the first client
- 7 computer.
- 1 18. (Original) The network of claim 17 further comprising a second client
- 2 computer coupled to the transmission medium, the server computer transmits the first ID
- data to the second client computer upon receiving a request from the second client
- 4 computer to certify the first software-defined radio implemented at the second client
- 5 computer.
- 1 19. (Original) The network of claim 17 wherein the server computer transmits
- 2 second ID data to the first client computer upon receiving a request from the first client
- 3 computer to certify a second software-defined radio implemented at the first client
- 4 computer.
- 1 20. (Original) A method comprising:
- 2 receiving a request at a server computer to certify a first software-defined radio
- 3 implemented at a first client computer; and
- 4 transmitting first identification (ID) data corresponding to the first software-
- 5 defined radio to the first client computer.
- 1 21. (Currently Amended) The method of claim 21 further comprising transmitting a
- 2 radio protocol corresponding to first software-defined radio to the to the first client.
- 1 22. (Original) The method of claim 20 further comprising:
- 2 receiving a request at the server computer to certify the first software-defined
- 3 radio implemented at a second client computer; and

- 4 transmitting the first ID data to the second client computer.
- 1 23. (Original) The method of claim 20 further comprising:
- 2 receiving a request at the server computer to certify a second software-defined
- 3 radio implemented at the first client computer; and
- 4 transmitting second ID data corresponding to the second software-defined radio to
- 5 the second client computer.
